

SYSTEM FLOWCHARTS

Eight diagrams of how the game works, from a single swap to the long-term progression. Each mirrors the shipped code; the source is named on its page.

01 · CORE AND META LOOPS

How one siege feeds the long-term progression, and what brings the player back.

02 · SCREEN FLOW

Every screen and panel, and how the player moves between them.

03 · A MOVE: FROM THE BOARD TO THE TOWERS

How a swap becomes tower fire.

04 · THE SIEGE CLOCK

What one fixed tick of the simulation does.

05 · DAMAGE: ARMOUR, SHIELDS AND SPLITS

How a single hit resolves.

06 · THE DRAFT

Dealing, bad-luck protection and re-deals.

07 · SIEGE END: REWARDS AND THE SECOND CHANCE

How a siege ends and what it pays.

08 · CODE ARCHITECTURE

Rules in pure C#, MonoBehaviours only for display, input and animation.

COLOUR KEY

■ Entry / exit point

■ Failure state

■ Special / pure C# rules

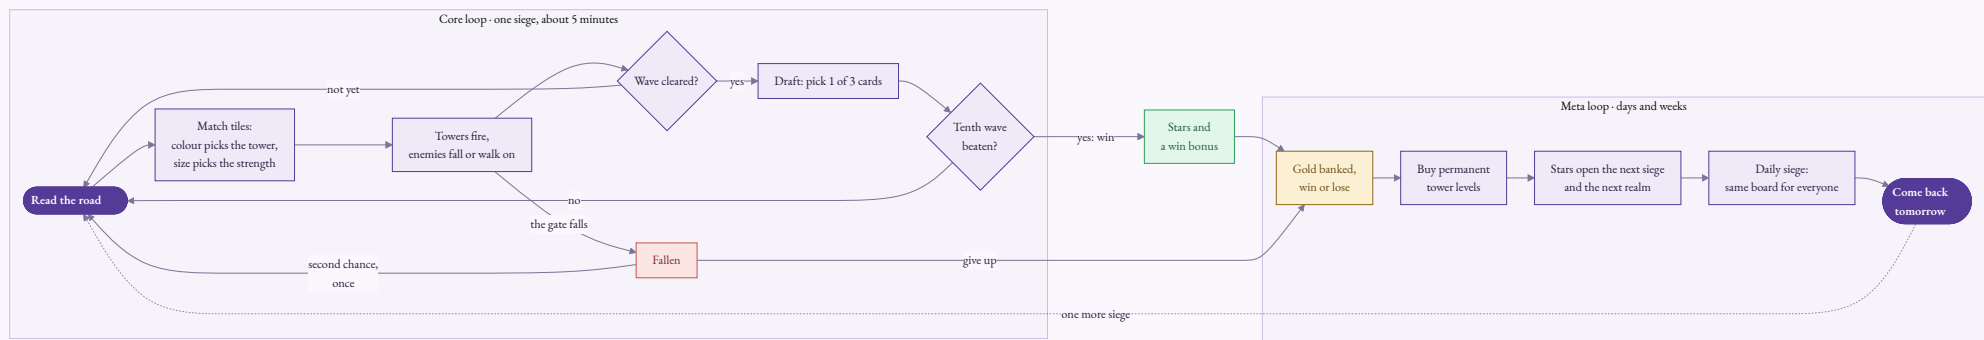

■ Reward or success

■ Gold, ads, services

■ Neutral path

CORE AND META LOOPS

How one siege feeds the long-term progression, and what brings the player back.

1 A siege is ten waves and a boss, with a draft between waves.

2 Losing still banks gold: every run moves you forward.

3 The daily siege gives a reason to open the app each day.

■ Entry / exit point

■ Reward or success

■ Failure state

■ Gold, ads, services

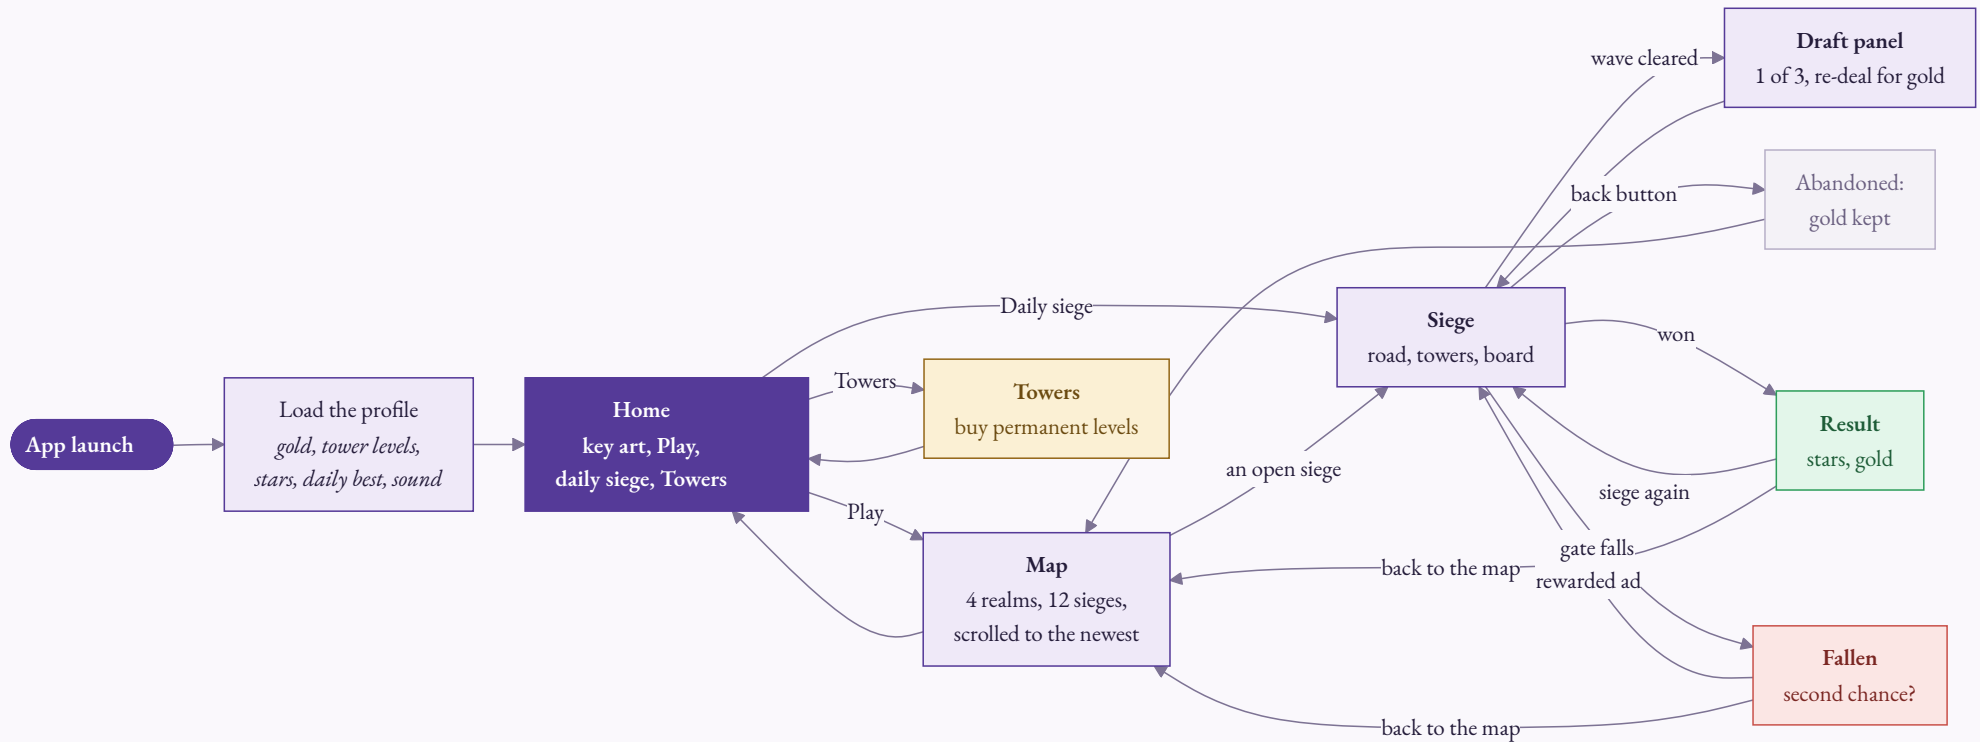

■ Special / pure C# rules

SCREEN FLOW

Every screen and panel, and how the player moves between them.

1 Home, the map, the Towers screen and the siege; the draft and results are panels.

2 The back button abandons but keeps the gold earned.

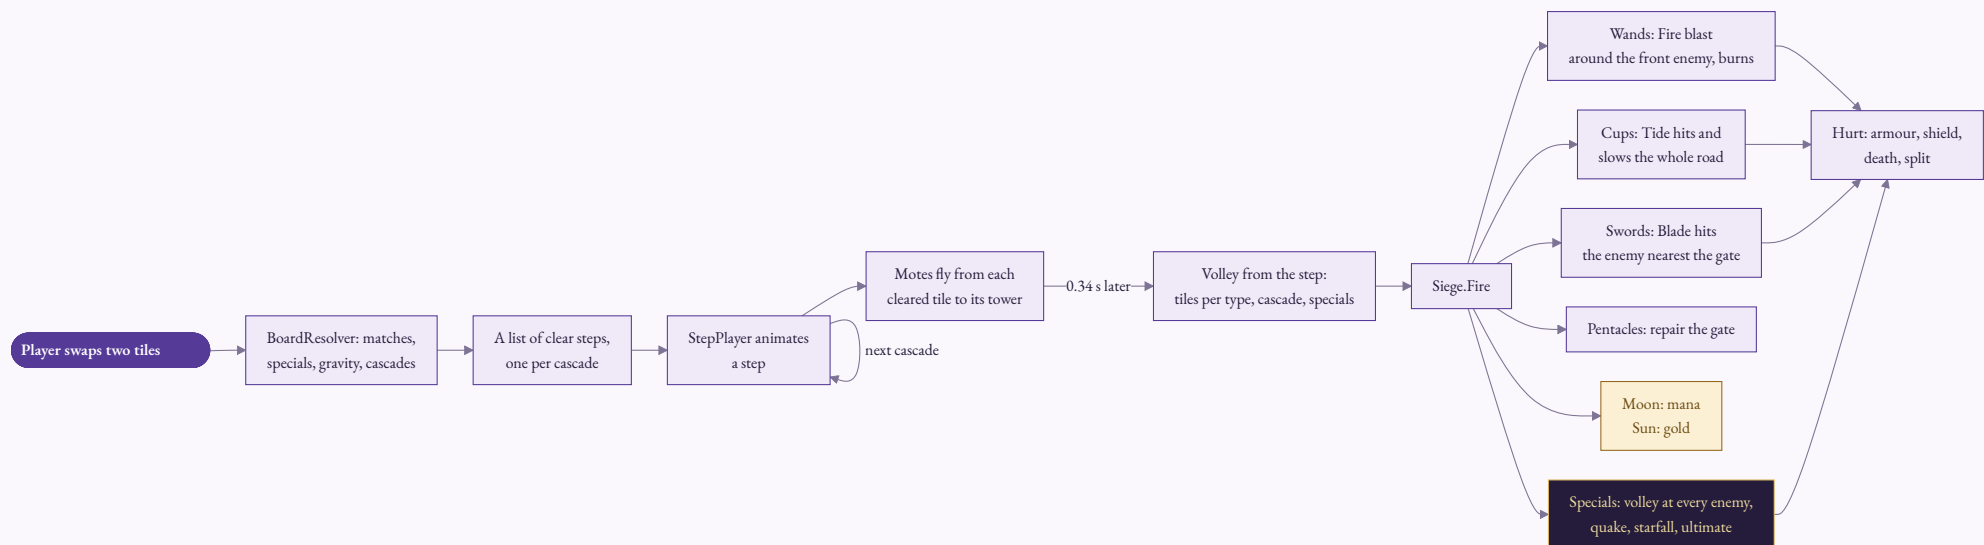

3 Gold nodes are monetisation hooks.

A MOVE: FROM THE BOARD TO THE TOWERS

How a swap becomes tower fire.

1 The board resolves instantly in pure C#; the view replays the steps.

2 Each cascade fires its own volley, 25% stronger per step.

3 Towers fire when the motes land, so the player sees the order carried out.

THE SIEGE CLOCK

What one fixed tick of the simulation does.

1 The clock stops during the draft; the board stays playable in the break after it.

2 Healing and burning run on the same tick as walking.

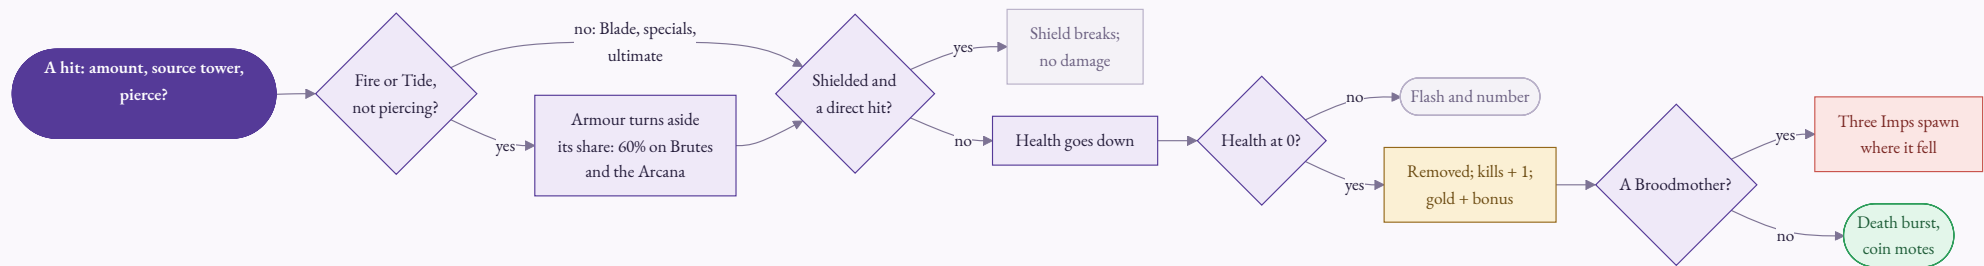

3 Win is checked only when every spawn is out and the road is empty.

`Siege.CheckWaveEnd`

DAMAGE: ARMOUR, SHIELDS AND SPLITS

How a single hit resolves.

1 Armour punishes spraying Fire and Tide; the Blade and the board's big plays pierce it.

2 A shield absorbs one direct hit of any size.

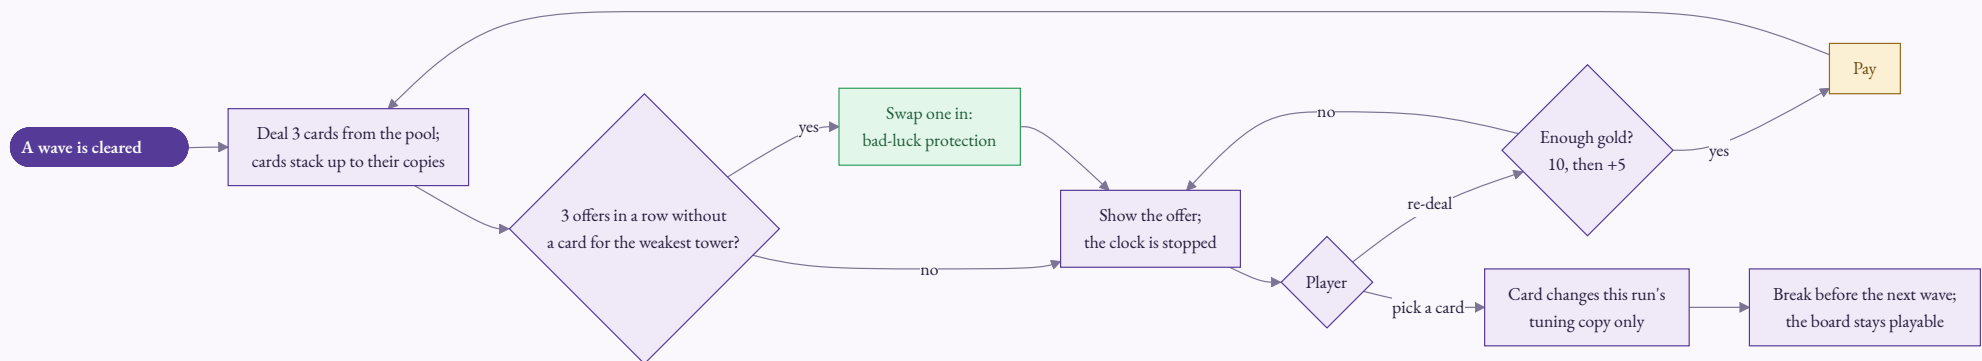

3 A Broodmother's Imps must also die before the wave ends.

- Entry / exit point
- Failure state
- Special / pure C# rules
- Reward or success
- Gold, ads, services
- Neutral path

THE DRAFT

Dealing, bad-luck protection and re-deals.

1 Cards change a copy of the tuning, never the shared numbers.

2 Protection guarantees help for the weakest tower.

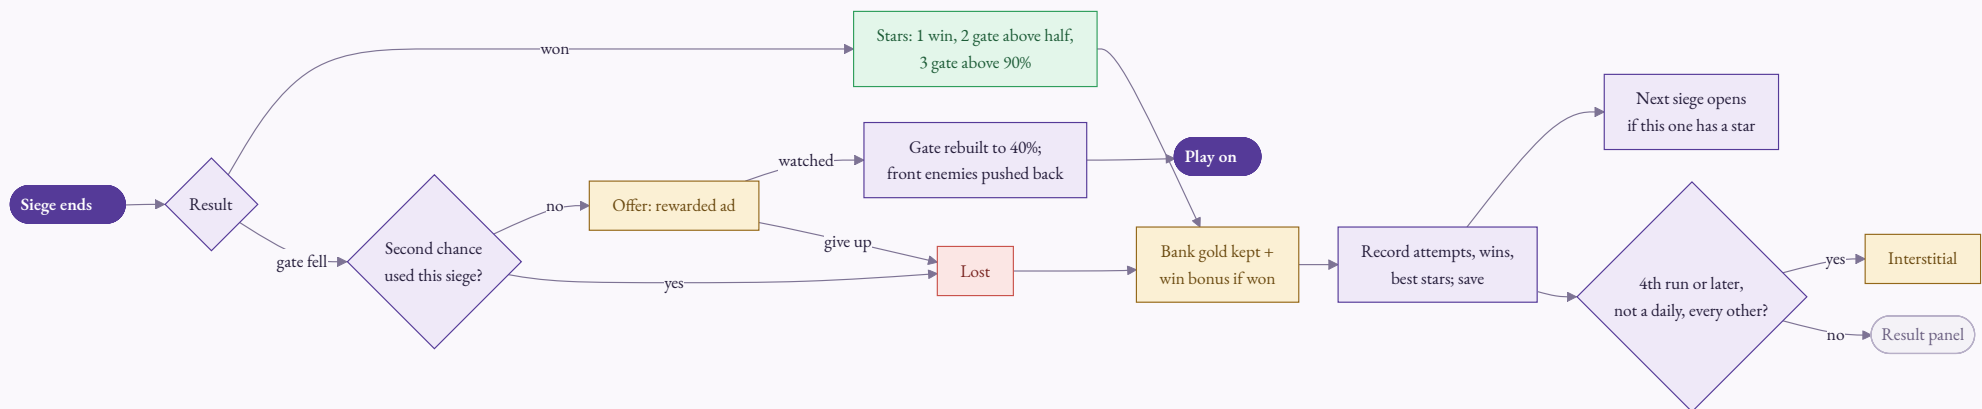

3 Re-deals are the only in-run gold sink.

- Entry / exit point
- Failure state
- Special / pure C# rules
- Reward or success
- Gold, ads, services
- Neutral path

SIEGE END: REWARDS AND THE SECOND CHANCE

How a siege ends and what it pays.

1 The second chance is offered once, before anything is banked.

2 Interstitials never show early or after a daily.

3 All ads and purchases go through the service interfaces.

Entry / exit point

Reward or success

CODE ARCHITECTURE

Rules in pure C#, MonoBehaviours only for display, input and animation.

1 The same Core code runs in the game, the tests and the balance runner.

2 The match-3 rules are reused unchanged from Arcana Match.

3 Colour key: dark = pure C# rules, gold = services behind interfaces.
